

Bausch + Lomb Announces Publication Of 10-Year Armor Study Results On Ocular Antibiotic Resistance In JAMA Ophthalmology

April 14, 2020

Surveillance Data Demonstrates Nationwide Prevalence of Antibiotic Resistant Bacteria Common in Eye Infections

BRIDGEWATER, N.J., April 14, 2020 /PRNewswire/ -- Bausch + Lomb, a leading global eye health business of Bausch Health Companies Inc. (NYSE/TSX: BHC), today announced that *JAMA Ophthalmology* has published 10-year results of the ongoing, multicenter, prospective Antibiotic Resistance Monitoring in Ocular microorganisms (ARMOR) surveillance study evaluating profiles and trends in antibiotic resistance among common ocular bacterial pathogens across the United States.¹ ARMOR is the only ongoing surveillance study of its kind.

The analysis of the 10-year results, which evaluated data from bacterial isolates collected from 2009 to 2018, showed that in vitro antibiotic resistance is prevalent nationwide among ocular staphylococci. One in three *Staphylococcus aureus* and one in two coagulase-negative staphylococci (CoNS) were methicillin-resistant, and three in four methicillin-resistant staphylococci were multidrug-resistant (to ≥three classes of antibiotics).

"Antibiotic resistance, which can complicate the choice of antibiotic in clinical practice and, in some cases lead to treatment failure, is a growing concern that can make it difficult for eye care professionals to effectively treat their patients with eye infections," said Penny A. Asbell, M.D., lead ARMOR study author, professor and chair, the University of Tennessee Health Science Center, and director, Hamilton Eye Institute, Memphis, Tenn. "Many eye care professionals treat their patients empirically, so the data collected in this unique ARMOR study are vital in that they can help guide eye care professionals in selecting the most appropriate treatment option to meet the needs of their patients."

In total, ARMOR study participants from 88 sites across 41 states collected a total of 6,091 isolates of *S. aureus*, CoNS, *Streptococcus pneumoniae*, *Pseudomonas aeruginosa* and *Haemophilus influenzae*, all organisms frequently implicated in bacterial infections of the eye. Overall, 34.9 percent of *S. aureus* and 49.3 percent of CoNS were methicillin-resistant and more likely to be concurrently resistant to other antibiotic classes. As well, multidrug resistance was high among methicillin-resistant *S. aureus* (75.4 percent) and CoNS (73.7 percent). In vitro resistance among *S. pneumoniae* was highest for azithromycin (36.3 percent); while *P. aeruginosa* and *H. influenzae* demonstrated low resistance overall. Differences in antibiotic resistance were found among isolates by patient age in staphylococci, by geographic region (all but *H. influenzae*), and over time.

"In everything we do, our goal is to help eye care professionals address their patients' needs for improved ocular health, and that includes providing them with the latest scientific data to inform their treatment decisions," said Joe Gordon, U.S. president, Bausch + Lomb. "Our ongoing support of the ARMOR research study has the potential to benefit millions of patients who develop common eye infections so they can be effectively treated with the most appropriate antibiotic."

About the ARMOR Study

The nationwide ARMOR study is an ongoing, multicenter, prospective, laboratory-based surveillance study sponsored by Bausch + Lomb. Initiated in 2009, the study was designed to extend the three-year Ocular TRUST (Tracking Resistance in the United States Today) study in surveying antibacterial resistance among clinically relevant ocular isolates of *S. aureus*, CoNS, *S. pneumoniae*, *P. aeruginosa*, and *H. influenzae* provided by community hospitals, academic/university hospitals, specialty/ocular centers and reference laboratories in the United States. Bacterial isolates submitted as part of ARMOR are sent to an independent central laboratory for in vitro susceptibility testing against representative antibiotics from 10 different classes as appropriate based on species.

About Bausch + Lomb

Bausch + Lomb, a leading global eye health business of Bausch Health Companies Inc., is solely focused on helping people see. Its core businesses include over-the-counter products, dietary supplements, eye care products, ophthalmic pharmaceuticals, contact lenses, lens care products, ophthalmic surgical devices and instruments. Bausch + Lomb develops, manufactures and markets one of the most comprehensive product portfolios in the industry, which is available in more than 100 countries. For more information, visit www.bausch.com.

About Bausch Health

Bausch Health Companies Inc. (NYSE/TSX: BHC) is a global company whose mission is to improve people's lives with our health care products. We develop, manufacture and market a range of pharmaceutical, medical device and over-the-counter products, primarily in the therapeutic areas of eye health, gastroenterology and dermatology. We are delivering on our commitments as we build an innovative company dedicated to advancing global health. More information can be found at www.bauschhealth.com.
